

Solo-Leveling-Inspired Fitness App — Product Flow Specification

A concise implementation brief for GitHub Copilot to adapt an existing fitness tracker into a progression-based Hunter System.

1. Product Vision

Core idea: The user is the Hunter. Real-world exercise becomes progression inside a game-like System. Every workout, run, challenge, and consistency milestone produces XP, improves Stats, unlocks Titles/Skills, and advances the user's Hunter Rank.

Core loop: System → Quest → Train → Track → Earn XP → Level Up → Improve Stats → Rank Up → Unlock Rewards → Take harder Quests/Dungeons/Bosses.

2. Main System / Dashboard

The dashboard should feel like a live **System Window**, not a conventional fitness dashboard. Show Hunter name, Rank, Level, XP progress, Stats, active Daily Quest, streak, recent activity, current challenge, and important System notifications.

Example: SYSTEM ONLINE → HUNTER: [Name] → RANK: C → LEVEL: 27 → XP: 8,420/10,000 → STR / VIT / AGI / END / DEX / DISC.

3. Hunter Progression

Concept	App behavior
Hunter	The user/player.
Level	Overall progression based on earned XP.
XP	Earned from workouts, runs, quests, challenges and milestones.
Hunter Rank	Long-term fitness progression: E → D → C → B → A → S → optional higher tiers.
Rank Up	Triggered when defined progression requirements are met.
Stat Points	Optional rewards after level-ups; used to improve virtual Stats.

4. Fitness Stats

STR (Strength): strength exercises, resistance training, repetitions, load/performance.

VIT (Vitality): training consistency, recovery-related goals and overall training volume.

AGI (Agility): running speed, sprinting, jumping, agility/movement work.

END (Endurance): running distance/time and cardio performance.

DEX (Dexterity): mobility, balance and coordination activities.

DISC (Discipline): consistency, streaks and completed planned sessions.

Important: Stats are primarily a gamification/progression layer. Do not present virtual stats as medical measurements.

5. Quest System

Daily Quest: recurring daily fitness objectives. Example: 5 km run, push-ups, squats, mobility.

Emergency Quest: time-sensitive optional challenge triggered by a defined event.

Quest Reward: XP, virtual currency, Titles, cosmetic rewards, Skills or Stat Points.

Quest Failure: show a System warning and optionally assign a small, safe recovery/accountability task. Never use harmful exercise as punishment.

6. Dungeons

A Dungeon is a structured multi-stage workout. Each Dungeon has a Rank/Difficulty, stages, completion rules, XP rewards and optional bonus rewards.

Example: D-Rank Dungeon → Stage 1: Squats → Stage 2: Push-ups → Stage 3: Lunges → Stage 4: Plank → Stage 5: 1 km Run → Dungeon Clear → XP + rewards.

7. Gates & Challenges

A Gate is a larger time-bound challenge, such as a 30-day consistency trial, 50 km monthly run, or 1,000-repetition challenge. Gates should track objective progress and show remaining time/progress.

8. Boss Battles

Boss Battles convert major fitness milestones into a visual game objective. The Boss has a progress/HP bar that decreases as the user completes the required activity.

Examples: 5K Boss, 10K Boss, 100 Push-Up Boss, 30-Day Consistency Boss. On completion: BOSS DEFEATED → XP → Title/Reward.

9. Skills & Titles

Skills: unlockable progression mechanics tied to achievements. Example: *Iron Will* after a long streak, or *Marathon Mind* after a distance milestone.

Titles: achievement badges displayed on the Hunter profile. Examples: *The Awakened*, *Iron Will*, *Dungeon Breaker*, *Distance Hunter*, *Unyielding*, *S-Rank Hunter*.

10. Shadow / Collection Layer

Use a collectible achievement layer inspired by the idea of a Shadow Army. Each major achievement can unlock a collectible Guardian/Shadow-style entry representing that accomplishment. Keep this layer primarily cosmetic or progression-oriented.

11. Rewards & Inventory

Create a virtual Inventory containing Titles, achievement badges, cosmetic items, artifacts/gear and challenge rewards. Rewards can provide XP bonuses or cosmetic/profile benefits rather than unrealistic physical advantages.

12. Tracking & Real-World Data

The app should track workouts and running sessions, then translate them into progression. Useful inputs include duration, distance, pace, repetitions, sets, workout type, calories where available, heart-rate data where supported, and completion/consistency.

Progress calculation should avoid XP farming: XP should consider activity difficulty, duration/volume, performance and consistency instead of rewarding unlimited easy repetitions.

13. Recommended App Navigation

Screen	Purpose
System / Home	Hunter status, Level, Rank, XP, Stats, active Quest and notifications.
Quests	Daily, weekly, emergency and custom Quests.
Dungeons	Structured workouts and multi-stage sessions.
Gates	Longer time-bound challenges.
Bosses	Major milestone challenges with visual progress.
Training	Start/log workouts and runs.
Stats	Detailed progression and historical performance.
Hunter Profile	Rank, Titles, achievements, streaks and overall progress.
Inventory	Rewards, artifacts, cosmetics and collectibles.
System Log	Level-ups, rank-ups, quest completion and important events.

14. System Event Examples

- SYSTEM ONLINE — Hunter detected.
- DAILY QUEST GENERATED — Complete today's objectives.
- QUEST COMPLETE — XP awarded.
- LEVEL UP — New Level reached; apply rewards.
- STAT INCREASE — Show which Stats changed.
- RANK UP — New Hunter Rank unlocked.
- DUNGEON ENTERED — Start multi-stage workout.
- DUNGEON CLEARED — Award completion rewards.
- GATE OPENED — Start a time-bound challenge.
- BOSS DEFEATED — Award major milestone rewards.
- NEW TITLE ACQUIRED — Add to Hunter profile.
- NEW SKILL UNLOCKED — Add to Skills collection.

15. Implementation Priorities for GitHub Copilot

- **P1 — Preserve existing functionality:** inspect the current app architecture before changing data models or navigation.
- **P2 — Add progression engine:** XP, Level, Rank, Stats and level-up calculations.
- **P3 — Add Quest engine:** Daily/Weekly/Emergency/Custom quests with status, deadlines and rewards.
- **P4 — Add challenge engine:** Dungeons, Gates and Bosses with progress tracking.
- **P5 — Add achievement engine:** Titles, Skills, milestones and collectible rewards.
- **P6 — Add System UI:** System notifications, progress bars, rank/level presentation and event log.
- **P7 — Integrate real activity data:** map workout/running metrics to XP and Stats.
- **P8 — Add safeguards:** prevent duplicate activity submissions, XP farming and unsafe penalty mechanics.

16. Core Data Model (Conceptual)

```
Hunter { id, name, level, xp, rank, stats, streak, titles, skills, inventory }
Quest { id, type, title, objectives, difficulty, status, startTime, endTime, rewards }
Workout { id, type, duration, distance, repetitions, sets, metrics, completedAt, xpAwarded }
Dungeon { id, rank, stages, status, progress, rewards }
```

```
Gate { id, title, objectives, deadline, progress, rewards }
Boss { id, title, hp/target, currentProgress, difficulty, rewards, status }
Achievement { id, title, requirement, unlockedAt, reward }
SystemEvent { id, type, message, timestamp }
```

17. Design Principle

The app should make the user's real fitness journey feel like a progression story. Avoid turning it into a normal fitness tracker with decorative game elements. The System, Quests, XP, Levels, Ranks, Dungeons, Bosses, Skills and Titles should be interconnected.

18. Important IP/Branding Note

The terminology in this specification intentionally references Solo Leveling concepts for product direction. If the app will be publicly distributed or commercialized, review licensing/trademark/copyright requirements and consider creating original names, artwork, characters and lore rather than copying protected assets or story content.
